A PACIFIC WEATHER SYSTEM WILL MOVE INTO SOUTHWESTERN CALIFORNIA
TUESDAY AFTERNOON AND EVENING...BRINGING PERIODS OF LIGHT
PRECIPITATION TO THE REGION. PERIODS OF LIGHT RAIN WILL BEGIN
AROUND MIDDAY ACROSS COASTAL ORANGE COUNTY AND THE NORTHERN
AREAS...BEFORE SPREADING SOUTH AND EAST DURING THE AFTERNOON AND

PRECIPITATION AMOUNTS REMAINING PRIMARILY LESS THAN A QUARTER
INCH IN MOST AREAS FROM THE MOUNTAINS WEST TO THE COAST. THE

I tried again to participate in the net, but I just can't hit any of the Palomar repeaters from where I live. Palomar is so far north in the county, it is almost in Riverside County, and I am the opposite end of the county. I would very much like to be active in the nets. I became involved with Skywarn because it was an activity where I could use ham radio to make reports, and I wanted to expand my use of ham radio. Is there a weekly NET on any of the HF bands for our local area?

Hi, Tom:

We are exploring the possibility of using the RACES repeaters for nets. The idea of an HF net has also been kicked around and I wouldn't mind trying an informal HF net just to see if it is something that would work for us. I'm thinking 20 or 15 m. What do you suggest?

Thanks for your input!

If we could get an Echolink going that would be great alternative for stations unable to hit repeaters - I'm in Barstow so i can't hit our Crestline repeater for that net as well - echolink could be used to fill the gaps if we could get that going - software is free...

Another good idea! I'm not Echolink savvy, though I have loaded the software. If you have expertise in that area, I would certainly like to hear your suggestions and see how many other members would be interested in participating.

hmmm echolink.... I seem to have a fairly good location for reaching the Crestline repeater and also the Palomar and RACES repeaters. I'm now wondering what will be involved for me to provide access to a xcvr via echolink such that I might be able to provide a node whereby echolink users could checkin to these various Skywarn nets. That is, on a timed basis, a node at my house could be setup to communicate to the previous mentioned repeaters for roll call nets and possibly callouts. For callouts, my node would give priority to San Diego County repeaters, though.

Not sure how to get started, so lemme do a little homework and get back to Laura.

I would recommend using as low a frequency as possible. I've always had the best reception on 80 meters and 40 meters, so if the choices were 20 and 15, I would go with 20 meters. I would be very happy to participate. I have enjoyed all of the Skywarn training that was provided, and I have used the "Skywarn Online" forum, and I have a spotter number, but I haven't really seen anything discussed about making reports using ham radio. I imagine that the weekly nets are practice for how we could go to a certain frequency during an activation period and make reports for our various areas, but I haven't found any information or training documents on this other than one sentance that said "ham radio is the preferred method for reporting information!"

I am also a RACES member, and I remember seeing a Skywarn representatinve at each of the monthly RACES meetings, but I haven't met him yet. I'm sure with this association, you could easily obtain permission to use the RACES repeaters, except for the fact that their use might be restricted during times of emergency, which may or may not be weather related.

Let me know what the next step is.

I tried again to participate in the net, but I just can't hit any of the Palomar repeaters from where I live. Palomar is so far north in the county, it is almost in Riverside County, and I am the opposite end of the county. I would very much like to be active in the nets. I became involved with Skywarn because it was an activity where I could use ham radio to make reports, and I wanted to expand my use of ham radio. Is there a weekly NET on any of the HF bands for our local area?

I'm now wondering what will be involved for me to provide access to a xcvr via echolink such that I might be able to provide a node whereby echolink users could checkin to these various Skywarn nets. That is, on a timed basis, a node at my house could be setup to communicate to the previous mentioned repeaters for roll call nets and possibly callouts. For callouts, my node would give priority to San Diego County repeaters, though.

We are planning to conduct a SKYWARN drill soon and I see no reason why we can't try out several repeaters, plus HF. If you check http://swskywarn.org/Communications.htm you'll see that we already have HF frequencies assigned, so perhaps we can exercise a few of these.

Your comments are great, Tom! I appreciate the input. I will put together a "cheat sheet" quick reference on SKYWARN reporting via radio and send it out to all after it gets approved by the Area Coordinator.

Thanks,
Laura

That's interesting you should mention that link because I was just looking at that page less than 5 minutes ago! I wondered what was meant about "Primary," "Secondary," and "Tertiary." Does that mean to try the primary frequency first, and if it is in use, go to the secondary (etc.) frequency instead? And is the difference between the "night" and "day" frequencies have to do with band propagation?

Exactly. I think the HF freqs would depend on propagation and who we're trying to talk to. I haven't had much luck with local use of HF (but that's not what it's for!) Still might be fun to try it.

Actually, the RACES hams I've been working with lately are beginning to realize that there is a lot of merit in using HF over UHF/VHF for the same reasons we've been discussing, namely, not all areas are able to hit the same repeater, but all hams on HF should all be able to talk together whether we're one mile apart or a thousand miles apart. We have some HF nets for ARES/RACES/SATERN on Sunday morning that we enjoy (Red Cross also checks in, and Skywarn is invited, but nobody from Skywarn ever checks in). The first, at 8:15AM is for North SD County, 8:15 is Imperial County, then at 9AM, we have the San Diego section net. Also, on Monday evenings, there is a Statewide net for all of the EOC directors and assistants, followed by our local San Diego area EOC net which I usually participate in also. Let me know if you need any of these frequencies. They are all on 75/80 meters. Also, on HF, all of California plus Arizona, Nevada and New Mexico are usually very strong signals, so the Skywarn net could be extended to include our neighbors!

The only problem is that HF requires at least a General Class license, whereas any licensed amateur operator could check into the VHF nets. But that's why we have so many upgrade classes scheduled! I'm a VE for both ARRL and Sandarc, so I am available to help Skywarn hams pass their General or Extra class examps, if I'm needed! Keep in touch!

Exactly. I think the HF freqs would depend on propagation and who we're trying to talk to. I haven't had much luck with local use of HF (but that's not what it's for!) Still might be fun to try it.

And is the difference between the "night" and "day" frequencies have to do with band propagation?

We are planning to conduct a SKYWARN drill soon and I see no reason why we can't try out several repeaters, plus HF. If you check http://swskywarn.org/Communications.htm you'll see that we already have HF frequencies assigned, so perhaps we can exercise a few of these.

Your comments are great, Tom! I appreciate the input. I will put together a "cheat sheet" quick reference on SKYWARN reporting via radio and send it out to all after it gets approved by the Area Coordinator.

Thanks,
Laura

I would recommend using as low a frequency as possible. I've always had the best reception on 80 meters and 40 meters, so if the choices were 20 and 15, I would go with 20 meters. I would be very happy to participate. I have enjoyed all of the Skywarn training that was provided, and I have used the "Skywarn Online" forum, and I have a spotter number, but I haven't really seen anything discussed about making reports using ham radio. I imagine that the weekly nets are practice for how we could go to a certain frequency during an activation period and make reports for our various areas, but I haven't found any information or training documents on this other than one sentance that said "ham radio is the preferred method for reporting information!"

I am also a RACES member, and I remember seeing a Skywarn representatinve at each of the monthly RACES meetings, but I haven't met him yet. I'm sure with this association, you could easily obtain permission to use the RACES repeaters, except for the fact that their use might be restricted during times of emergency, which may or may not be weather related.

Let me know what the next step is.

Hi, Tom:

We are exploring the possibility of using the RACES repeaters for nets. The idea of an HF net has also been kicked around and I wouldn't mind trying an informal HF net just to see if it is something that would work for us. I'm thinking 20 or 15 m. What do you suggest?

Thanks for your input!

I became involved with Skywarn because it was an activity where I could use ham radio to make reports, and I wanted to expand my use of ham radio. Is there a weekly NET on any of the HF bands for our local area?

Great information! I confess that I only have 15 and 20 m dipoles in the air at the moment, with 10 and 40 in reserve. Seriously considering a G5RV if I can fit it in my backyard :) I definitely think we should pursue the HF angle, if only for a backup to our local nets.

I'm an ARRL VE, as well. We are hoping to eventually do a license session here in San Marcos for our CERT team, but in the meantime, I'm teaching a pair of Tech License Study Classes in July with testing in Escondido at the end of that month. I encourage upgrades to General and Extra, too! There's so much more fun on HF.

Take care,
Laura

Laura - The G5RV antenna will work very well as a "sloper," meaning that if you can get the center up high enough, the ends wouldn't have to be that far away. If you could erect a 50 foot pole in the center of your property boundary, you should be able to get the ends anchored before you run out of room. I have a verticle antenna that I might be selling, a Gap Titan, which is good from 80 to 10 meters. But in the meantime, let's get started ASAP with either 15 or 20 meters. Let me know the details and I'll be happy to join you on HF!

...or even 40m if you indeed have a 40m antenna in reserve. I can help you with such antenna projects (except for this Saturday, Mar 31).

Laura - The G5RV antenna will work very well as a "sloper," meaning that if you can get the center up high enough, the ends wouldn't have to be that far away. If you could erect a 50 foot pole in the center of your property boundary, you should be able to get the ends anchored before you run out of room. I have a verticle antenna that I might be selling, a Gap Titan, which is good from 80 to 10 meters. But in the meantime, let's get started ASAP with either 15 or 20 meters. Let me know the details and I'll be happy to join you on HF!

Ah, it is so refreshing to hear that someone is actually willing to tune their antenna properly rather than just dialing out the mismatch with an antenna tuner! Bravo!

Correction: I have an antenna ANALYZER, not to be confused with an antenna tuner. I agree with Tom's comments regarding at least attempting to tune an antenna where possible before resorting to an antenna tuner. I don't know how long I'll have this antenna analyzer, because it's not mine.

I'm willing to assist Laura in setting up and tuning 40 meters with my analyzer. I've been trying to get her on 40 anyway.. I'll have some time on Friday if that will work for you Laura. I have a PT appointment at 14:30 and I'm trying to set up and meeting with W6YOO on Friday for a field card check around noon.

Greetings,

The COMET Program is pleased to announce the publication of the new module, "Topics in Dynamic Meteorology: Thermal Wind".

This 1 to 1.5 hour module explores the dynamic links between temperature, pressure, and wind in the atmosphere. The qualitative description of the relationships is augmented with "Math Sidebars" that provide a quantitative treatment. Numerous applications to climatology and forecasting illustrate the application of concepts in the module.

The intended audience for this module is novice forecasters and meteorologists. Please follow this link to the MetEd description page that provides additional information and a link to begin the module: Topics in Dynamic Meteorology: Thermal Wind.

Most COMET modules use JavaScript and Adobe® Flash® for navigation, animation, and/or presentation of multimedia elements. Ensure that you have a browser updated to its latest version with JavaScript enabled and the latest version of the Adobe FlashPlayer installed (http://get.adobe.com/flashplayer/). For technical support for this module please visit our Registration and Support FAQs at https://www.meted.ucar.edu/resources_faq.php

We welcome any comments or questions you may have regarding the content, instructional approach, or use of this module. Please e-mail your comments or questions to Alan Bol (alanbol@...).

Greetings,

The COMET Program is pleased to announce the publication of the new module, "Topics in Dynamic Meteorology: Thermal Wind".

This 1 to 1.5 hour module explores the dynamic links between temperature, pressure, and wind in the atmosphere. The qualitative description of the relationships is augmented with "Math Sidebars" that provide a quantitative treatment. Numerous applications to climatology and forecasting illustrate the application of concepts in the module.

The intended audience for this module is novice forecasters and meteorologists. Please follow this link to the MetEd description page that provides additional information and a link to begin the module: Topics in Dynamic Meteorology: Thermal Wind.

Most COMET modules use JavaScript and Adobe® Flash® for navigation, animation, and/or presentation of multimedia elements. Ensure that you have a browser updated to its latest version with JavaScript enabled and the latest version of the Adobe FlashPlayer installed (http://get.adobe.com/flashplayer/). For technical support for this module please visit our Registration and Support FAQs at https://www.meted.ucar.edu/resources_faq.php

We welcome any comments or questions you may have regarding the content, instructional approach, or use of this module. Please e-mail your comments or questions to Alan Bol (alanbol@...).

Greetings!

The COMET Program is pleased to announce the publication of "Satellite Feature Identification: Atmospheric Rivers". This 1-hour module contains six sections that guide the learner through the definition, components, and impacts of Atmospheric Rivers (ARs), with an emphasize on satellite observation tools. The module starts by defining the AR and demonstrating the utility of advanced satellite tools. Next, the module focuses on the moisture and moisture transport component of ARs using both satellite and NWP products to observe and forecast AR evolution. Next is an exploration of forecasting precipitation associated with ARs. And finally some real AR cases are demonstrated before a summary of the main points. This module is part of the series: "Dynamic Feature Identification: The Satellite Palette".

This module includes many satellite animations and graphics along with frequent interactive questions to facilitate learning. Please follow this link to the MetEd description page that provides additional information and a link to begin the module: Satellite Feature Identification: Atmospheric Rivers.

Most COMET modules use JavaScript and Adobe® Flash® for navigation, animation, and/or presentation of multimedia elements. Ensure that you have a browser updated to its latest version with JavaScript enabled and the latest version of the Adobe FlashPlayer installed (http://get.adobe.com/flashplayer/). For technical support for this module please visit our Registration and Support FAQs at https://www.meted.ucar.edu/resources_faq.php.

We welcome any comments or questions you may have regarding the content, instructional approach, or use of this module. Please e-mail your comments or questions to Matt Kelsch (kelsch@...) or Bryan Guarente (guarente@comet.ucar.edu).

Daniel,
   are you doing the 2m net tonight?

Chuck,
   My HF antenna(s) won't be up for another week or two. Maybe we can do an HF net during the day on a Saturday or something(?). 40m tends to stretch out around sunset as I recall.

What does the group think about a monthly gathering, moved around the county from momth to month in order to be fair about driving times? We'll need suggestions for venues and so on, like Tom's pool... :)

Greetings!

The COMET Program is pleased to announce the publication of "Weather Radar Fundamentals." This 2-hour module is intended as an introduction to the basic principles of Doppler weather radar operation and interpretation. It can also serve as a refresher for more experienced users. In addition to discussing the science behind radars, the module provides examples and practice exercises for interpreting reflectivity and velocity products for a variety of fair weather and precipitating weather situations.

Please follow this link to the MetEd description page that provides additional information and a link to begin the module: Weather Radar Fundamentals.

Most COMET modules use JavaScript and Adobe® Flash® for navigation, animation, and/or presentation of multimedia elements. Ensure that you have a browser updated to its latest version with JavaScript enabled and the latest version of the Adobe FlashPlayer installed (http://get.adobe.com/flashplayer/).
